

## DISEÑO DE FILTRO PASABANDA K-CONSTANTE MEDIANTE MATLAB

Frecuencia de corte inferior fc1 [Hertz] = 5000 Frecuencia de corte superior fc2 [Hertz] = 6000 Impedancia de carga Ro [Ohms] = 600

La pulsacion de corte inferior wc1 es 31415.9265 [rad/seg]

La pulsacion de corte superior wc2 es 37699.1118 [rad/seg]

La pulsacion de resonancia al cuadrado wo2 es 1184352528.1307 [rad/seg]2

El ancho de banda AW es de 6283.1853 [rad/seg]2

El valor del inductor serie L1 es de 190.985932 [mH] ---> L1/2 es de 95.492966 [mH]

El valor del capacitor serie C1 es de 0.004420971 [uF] ---> 2\*C1 es de 0.008841941 [uF]

El valor del inductor paralelo L2 es de 1.591549 [mH]

El valor del capacitor paralelo C2 es de 0.530516477 [uF]

## CALCULO POR NORMALIZACION Y TRANSFORMACION DE FRECUENCIA

L1/2 = 1 \* Ro / BW = 600.0000 / 6283.1853 = 95.492966 [mH]

2\*C1 = 1 / (ro\*wo2/BW) = 6283.1853 / (600.0000\*1184352528.130723) = 0.008841941 [uF]

L2 = (0.5 \* Ro \* BW) / wo2 = (0.5 \* 600.0000 \* 6283.1853) / 1184352528.130723 = 1.591549 [mH]

C2 = 2 / (ro \* BW) = 2 / (600.0000 \* 6283.185307) = 0.530516477 [uF]

## **COMPROBACION**

Ro = sqrt (L1 / C2) = sqrt (0.190986 [H] / 0.000000530516 [F]) = 600.0000 [Ohms]

Ro = sqrt (L2 / C1) = sqrt (0.001592 [H] / 0.000000004421 [F]) = 600.0000 [Ohms]

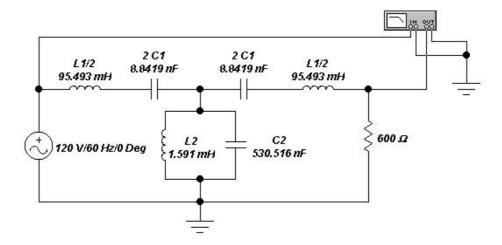

BW = 2 / (sqrt (L1 \* C2)) = 2 / (sqrt (0.190986 [H] \* 0.000000530516 [F])) = 6283.1853 [rad/seg]

 $wo2 = 1 / (L1 * C1) = 1 / (0.190986 [H] * 0.000000004421 [F]) = 1184352528.1307 [(rad/seg)^2]$ 

 $wo2 = 1 / (L2 * C2) = 1 / (0.003183 [H] * 0.000000265258 [F]) = 1184352528.1307 [(rad/seg)^2]$
